Prior social science research examining how weather and climate change experience influences climate risk perceptions and other opinions, however, has found mixed results. Values, cultural identities, and politics tend to dominate over direct experience as drivers of climate beliefs, concerns, and policy preferences (Egan and Mullin, 2017, McCright and Dunlap, 2011, Weber and Stern, 2011, **Marquart-Pyatt et al., 2014**, Mildenberger and Leiserowitz, 2017). Correspondingly, descriptive analysis

experienced global warming. We do not find robust evidence that other precipitation and **temperature anomalies** have had a similar effect. We also use multilevel modeling to explore county-level patterns of perceived experiences with climate change. Whereas the individual-level analysis describes a likely causal relationship between a changing climate and individuals' perceived experience, the multilevel model depicts county-level changes in perceived experience resulting from particular climate trends. Overall, we find that exposure to hot dry days, has a modest influence on perceived experience, independent of the political and socio-
